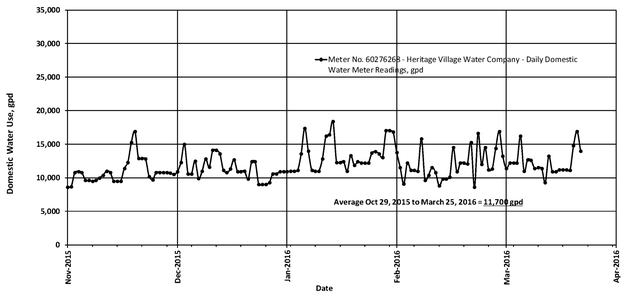
1. DESIGN DATA

A. Existing Wastewater Flows:

1. Based on daily domestic water meter readings (Heritage Village Water Company):



11,700 gpd average, water use from October 29, 2015 to March 25, 2016 - (logged daily at 8:00am data from Lutheran Home Maintenance staff).
The average daily flow for January 2016 was 13,135 gpd. This will be the design flow for the facility. During flow monitoring period, the facility was operating at 100% bed occupancy.

2. Determine Flow Split between two existing septic systems:

OWRS-301: 14 are beds connected - However, based on inspection of plumbing, only several water closets are connected. Based on dye testing of the connectivity of the plumbing, and CCTV inspection of the interior of all septic systems on the property, it was found the high water use fixtures and facilities serving the Parley Manor beds such as; cooking, bathing, and laundry were relocated to the more modern wing of the building. This results in discharge of that portion of the flow from those 14 beds to dischcarge to OWRS-302. Accordingly, sanitary flow generation for the 14 beds located in Parley Manor is conservatively estimated at 20gpd/bed discharging to OWRS-301.

Estimated average wastewater flow to existing old front system = 14 beds x 20 gpd/bed = 280 gpd

OWRS-302: 120 are beds connected + (Kitchen/Laundry/Bathing facilities, for the fourteen Parley Manor Beds) -
Existing system consists of 28 galleries of precast concrete, adjacent to larger, main parking lot
Remainder of the average wastewater flows to existing field near Parking Lot = 13,135 - 280 = 12,855 gpd**

B. Flow Allocation Summary:

Description	Number	Based on Metered Flows
Existing # of Beds	120 - Certified Nursing	12,855 gpd (107 gpd/bed)**
	14 - Residential Care Home (Parley Manor)	280 gpd (20 gpd/bed)
Totals		
Existing Beds	134	13,135 gpd

Note: See Section 4 Tank Capacity Calculations on this sheet for flow equalization storage calculation

C. Influent Wastewater Characteristics:	(Sampling Date)* 1/16/2015	6/24/2015	Design Value
BOD-5	320 mg/L	190 mg/L	250 mg/L

Total Phosphorus	2.5 mg/L	ND	20 mg/L***
Total Suspended Solids	72 mg/L	660 mg/L	250 mg/L

* Grab Samples obtained from Existing Pumping Chamber on date indicated
** Value is based on operational data for two similar nursing homes, both in terms of number of beds, and day-to-day establishment operations. Composite influent samples are collected in accordance with the WWTF/Pre-Treatment operating permits, and are collected from effluent pump station discharge pipe at the headworks. The pump chambers are preceded by septic tanks. see attached engineering report.

DP 111 also @ 72" 0.792 ft/day

2. LONG TERM ACCEPTANCE RATE (LTAR) CALCULATION:

A. OWRS-302 (Existing / Eastern Larger SWAS "1980's/1995 repair, adjacent to Large Parking Lot)

Per Section X, Pg. 4 of 82, CT DEEP Large Scale OWRS Design Guidance, Feb. 2006
Adjustment Factor for LTAR to account for BOD-5 and TSS concentrations in the wastewater, is as follows:
--- Use BOD=300mg/L, TSS=300mg/, based on testing data, and other similar facility data ---
[250/(BOD5+TSS)]^(1/3)
= [250/(250+250)]^(1/3)
= 0.794

Per Section X, Pg. 4 of 82, CT DEEP Large Scale OWRS Design Guidance, Feb. 2006
LTAR, gpd/sf = 5K - [1.2 / (Log(base-10)K)] , where K is in units of ft/min.

For OWRS-302, available vadose zone permeability values available were obtained from the most restrictive layer observed during deep hole testing. The following permeability values are representative of the soils in the area of the existing OWRS-302.

- BETA Group Data
  Testhole #B-10, from the C1-Layer, 2.80 ft/day
- Dudley Ashwood Report
  Testhole # DP110, from 48" depth, 1.600 ft/day
  Testhole # DP111, from 72" depth, 0.655 ft/day
  Testhole # DP111, also from 72" depth, 0.792 ft/day

conservatively use K = 0.655 ft/day, which is the lowest value of stated in the Dudley Ashwood Report
5 [(0.655 ft/day) / (1440min/day)] - [1.2 / (Log(base-10)(0.655/1440))]
= 0.361 gpd/sf

Therefore adjusted LTAR = 0.361 x 0.794 = **0.287 gpd/sf** (Note Prior / CT DEEP Approved Dudley Ashwood Report assessed 0.37 to 0.41 gpd/sf, based on permeability testing1980's)

B. OWRS-301 (Existing / Western SWAS "Old original SWAS serving Parley Manor, adjacent to Route 6 / Main Street North")
No test pits were performed in this area.

3. INFILTRATIVE SURFACE AREA CALCULATIONS

1. Determine Effective Leaching Surface Area (ELA): Use Geomatrix GST 6212 (12.0" Height, 62" wide), with Soilair system, provides 17.6 SF/LF, as follows:

CT DEEP
ELA/lf = [1.5 X inside clear (unmasked) bottom of leaching unit + 1.0 X effective stone masked bottom area] + [1.0 X effective stone-masked sidewall areas of leaching units]

Effective Leaching Area (ELA) in an 8" System Section: (Refer to Calculation Definition Sketch):

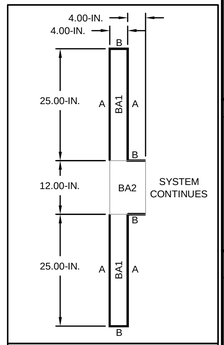
A. Unmasked Bottom Area ("UBA"):
None.

B. Masked Bottom Area ("MBA"):
MBA = Area of (2 X BA1) + BA2 (see attached diagram)
BA1 Area = 2(25 in. X 4 in.) = 200 sq.in.
BA2 Area = (8 in. X 12 in.) = 96 sq.in.
MBA = 296 sq.in. / (144 sq.in. / 1 sf) = 2.1 sf

C. Effective Sidewall Area ("ESA")
SA Sidewall (SW) = Height x Length x number of segments (in.)
SA SW (Side A x 4) = 12 in. x 25 in. x 4 = 1200 sq.in. / (144 sq.in / 1 sf) = 8.3 sf
SA SW (Side B x 4) = 12 in. x 4 in. x 4 = 192 sq.in. / (144 sq.in. / 1 sf) = 1.3 sf
TOTAL ALLOWABLE SIDEWALL AREA 9.6 sf

Total ELA/lf = [[1.5 X 0.0 (UBA) + 1 X 2.1 (MBA)] + [1.0 X 9.6 (ESA)]] X 1.5 = 17.55 sf/lf, use 17.6

Note: The value 1.5 Conversion from 8 in. section of system to 1 ft. section of system.
Interior Storage Volume = 9.23 gallons/linear foot, per Geomatrix



DEFINITION SKETCH FOR GST-6212
(FOR ELA CALCULATION)
SCALE 3/4" = 1'

Notes:
1. Typical 8-inch section of gst-6212
2. BA1, BA2 represent bottom area segments
3. A, B represent sidewall segments

2. Provide repair/replacement for Existing/Average Flows (12,855 gpd)
Assumptions:
0.287 gpd/sf loading rate for OWRS-302:

OWRS-1: Five (5) zones of GST-6212, consisting of two (2), 270-ft long trenches per zone, totaling 2,700 LF (Zones 1 - 5)

4. TANKS CAPACITY CALCULATIONS

(Existing Tanks to Remain in Operation)

1. Grease Trap Capacity:

Flow from the kitchen is not metered separately therefore direct effluent flow values are not available. To estimate the flow from the kitchen a value of 5 gallons per meal served was used (Table 4 Connecticut Public Health Code Technical Guidance for Take Out Restaurant). A 24-hour retention time is required for kitchen flow to a grease trap (CTDEEP Guidance Section IX page 3).

Required Volume: 134 beds x 3 meals per day x 5 gallons per meal = 2,010 gallons
Provided Volume: 2(number of grease traps in series) x 5'x10'x5.33'x7.48 gallon per cubic foot = 3,986 gallons (>2,010 gallons so OK)

2. Septic Tank Capacity:

A: Required Volume: CTDEEP Design Flows - 150 gallons per bed-day x 120 beds = 18,000 gallons per day
Actual Flows - 107 gallons per bed-day x 120 beds = 12,855 gallons per day
Provided Volume: 12,042 gallons + 5,864 gallons + 5,864 gallons = 23,770 gallons of septic tank provided (> than actual and required so OK)

B: Required Detention Time: CTDEEP requires 2-hour detention time during peak flow
Peak Flow = 13,135 gallons per day x 4.2 (Ten State Standard Ratio Q-peak hour / Q-design daily flow) / 24 hours per day = 2,299 gallons per hour
Detention Time = 23,770 gallons / 2,299 gallons per hour = 10.3-hour detention time (> 2-hour required during peak flow so OK)

3. Flow Equalization Calculation (Proposed Tanks):

Water use data for the facility was evaluated in order to assess flow equalization storage requirements. The month of January and the first few days of February had the highest monthly average daily flow of 12,855 gpd to OWRS-302. The volume available for equalization in the proposed pump chambers is 17,232 gallons. The control strategy for OWRS-302 will uniformly distribute 12,855 gallons of septic tank effluent on a daily basis. Flow beyond this value will be temporarily stored in the flow equalization storage capacity provided. During this time period the proposed flow equalization capacity provided 1,067 gallons of capacity beyond what was observed.

Required Volume: Flow equalization storage greater than peak cumulative flow during max month.
Provided Volume: The Maximum Stored Volume = 16,165 gallons (<17,232 gallons of storage provided)

Note: two tanks are provided for both flow equalization volume as well as for commissioning of theOWRS-302 . The existing system is being re-constructed in place to maintain xisting flows.

8. PHOSPHORUS SORPTION ANALYSIS

(Note: Only Zones 1 through 5 were considered in this calculation. Additional phosphorus storage is available if Zone 6 is utilized.)

Length of Trenches (ft)	Width of Trench (ft)	Height of Trench (ft)	Avg Phosphorus Loading (mg/L)[2]	Average Daily Flow (gal/day)	Thickness Unsaturated Soil (ft)	Soil P Adsorption (mg/100g)[5]	Soil Density (lb/cf)[1]
2,700	5.167	1	20	11,420	4.8	9	120

Total Effective Area[4] (ft^2)=	[=(2,700')*(5.167'+2*1')] =	19,350
Phosphorus Loading (mgP/day) =	[=(11,420 gal/day)*(20 mg/L)*(3.785 L/Gal.)] =	864,494
Phosphorus Loading (mgP/Month)	[=(30.4 day/month)*(864,494 mg P/day)] =	26,280,618
Soil Density (gm/cf)[1] =	[=(120 lb/cf)* 90% * (454 grams/lb)] =	49,032
Soil Adsorption of P (mg P)[3] =	[=(49,032 gm/cf) * (19,350 ft^2) * (4.8 ft) * 50% *(9 mgP/100gm)] =	204,934,147
Soil Capacity (months)=	[= (204,934,147 mg P) / (26,280,618 mg P/Month)] =	7.80 (> 6 months so OK[6])

Notes:

1: Soil density from Connecticut Experiment Station Bulletin 706 for Charlton soils maximum dry density = 120 lb/cf for C layer 30-48". Use 90% of max density based on typical insitu soil density.

2: Lab testing of two pump chamber effluent grab samples from the site were 2.5 mg/L and non detect. The previous report by Dudley Ashwood used 20 mg/l This value was used as a conservative estimate. The CTDEEP Design Guidance Section IV pg 14 also lists 20 mg/L as a maximum phosphorus value under Manuals & Textbooks.

3: As required in CTDEEP Design Guidance Section X pg 50 the unsaturated soil zone was reduced by 50%.

4: The effective leaching area is based on standard trench area (bottom and sidewalls),not the effective leaching area provided by the GST system.

5: The soil at the site is Charlton and was classified by Sawhney & Hill to have a sorption capacity of 21.8 mg P/100g of soil (B2 layer). Since test data has shown that sorption capacity is lower in the C soil layer the Merrimac soil sorption value of 9.0 mg/ 100 g soil was used as a conservative value.

6: CTDEEP Design Guidance Section X pg 50 item #5 requires the SWAS to adsorb at least 6 months of phosphorus in the percolate from the SWAS.

guidance requires 5 to 10 volumes of laterals per dose cycle Use = 7

Pipe Areas (ft^2):	2-0"=	0.0218	3"=	0.0491	4"=	0.0873	6"=	0.1963

Total lateral length (ft) =	540	
Volume of Laterals (gallons) =	88.1	
7 x Lateral Volume (gallons) =	617	
Manifold Volume (gallon) =	31.3	Length (ft) = 24
Force Main Volume (gallon) =	106.5	Length (ft) = 290

Dosing Volume (gallon) =	**800**	(Vol. = lateral vol. x 7 + manifold vol. + force main vol.)
Number of Doses per Day =	3	Design Flow (GPD) = 2,566

5: Determine Pump Flow Rate

Pump Flow Rate (gpm) =	**122**	(Based on 6 laterals times flow per lateral in gpm)

6: Total Headloss Pump Flow Rate

Distal Head (h_d) =	5.0	
Net Work Losses =	6.6	(Equal to 1.31xh_d per Guidance)
Force Main Losses =	17.2	(See calc sheet for force main headloss)
Static Head =	11.7	(See calc sheet for force main static head)
TDH (feet) =	**35.5**
